Bird Recognition in the City of Peacetopia (Case Study)

LATEST SUBMISSION GRADE 50%

1. Problem Statement

This example is adapted from a real production application, but with details disguised to protect confidentiality.

You are a famous researcher in the City of Peacetopia. The people of Peacetopia have a common characteristic: they are afraid of birds. To save them, you have to build an algorithm that will detect any bird flying overPeacetopia and alert the population.

The City Council gives you a dataset of 10,000,000 images of the sky above Peacetopia, taken from the city's security cameras. They are labelled:

- y = 0: There is no bird on the image
- y = 1: There is a bird on the image

Your goal is to build an algorithm able to classify new images taken by security cameras from Peacetopia.

There are a lot of decisions to make:

- · What is the evaluation metric?
- · How do you structure your data into train/dev/test sets?

Metric of success

The City Council tells you that they want an algorithm that

- 1. Has high accuracy
- 2. Runs quickly and takes only a short time to classify a new image.
- 3. Can fit in a small amount of memory, so that it can run in a small processor that the city will attach to many different security cameras.

Note: Having three evaluation metrics makes it harder for you to quickly choose between two different algorithms, and will slow down the speed with which your team can iterate. True/False?

○ True

1/1 point

After fur	ther discussior	s, the city	/ narrows o	down its	criteria	to:
-----------------------------	-----------------	-------------	-------------	----------	----------	-----

- "We need an algorithm that can let us know a bird is flying over Peacetopia as accurately as possible."
- "We want the trained model to take no more than 10sec to classify a new image."
- "We want the model to fit in 10MB of memory."

If you had the three following models, which one would you choose?

\bigcirc	Test Accuracy	Runtime	Memory size
	97%	3 sec	2MB

O B:

Test Accuracy	Runtime	Memory size
99%	13 sec	9MB

•	Test Accuracy	Runtime	Memory size
	98%	9 sec	9MB

\bigcirc	Test Accuracy	Runtime	Memory size
	97%	1 sec	3MB

Correctl As soon as the runtime is less than 10 seconds you're good. So, you may simply maximize the test accuracy after you made sure the runtime is <10sec.

3. Based on the city's requests, which of the following would you say is true?

0 / 1 point

- Accuracy, running time and memory size are all satisficing metrics because you have to do sufficiently well on all
 three for your system to be acceptable.
- Accuracy, running time and memory size are all optimizing metrics because you want to do well on all three.
- Accuracy is a satisficing metric; running time and memory size are an optimizing metric.
- Accuracy is an optimizing metric; running time and memory size are a satisficing metrics.

4. Structuring your data

1/1 point

Before implementing your algorithm, you need to split your data into train/dev/test sets. Which of these do you think is the best choice?

•	Train	Dev	Test
	9,500,000	250,000	250,000

0	Train	Dev	Test	
	6,000,000	1,000,000	3,000,000	

\bigcirc	Train	Dev	Test
	6,000,000	3,000,000	1,000,000

\bigcirc	Train	Dev	Test	
	3,333,334	3,333,333	3,333,333	

Yes.

	× Incorrect		
	Yes, because this shows your bias is higher than your variance.		
	Yes, because having 4.0% training error shows you have a high bias.		
	No, because this shows your variance is higher than your bias.		
	No, because there is insufficient information to tell.		
	This suggests that one good avenue for improving performance is to train a bigger training error. Do you agree?	network so as to drive down the 4.0%	
	Dev set error	4.5%	
	Training set error	4.0%	
7.	You train a system, and its errors are as follows (error = 100%-Accuracy):		0 / 1 point
	A bigger test set will slow down the speed of iterating because of the computa on the test set.	tional expense of evaluating models

You should get a bigger test set.

You have only 1,000 images of the new species of bird. The city expects a better system from you within the next 3 months. Which of these should you do first?

0	Put the 1,000 images into the training set so as to try to do better on these birds.
0	Try data augmentation/data synthesis to get more images of the new type of bird.
0	Use the data you have to define a new evaluation metric (using a new dev/test set) taking into account the new species, and use that to drive further progress for your team.
•	D: Add the 1,000 images into your dataset and reshuffle into a new train/dev/test split.

X Incorrect

Feedback: It could have helped if you had enough data to represent the new species of bird, but in your case the new data is scarce (1,000 new images comparing to the dataset of 10,000,000 images). You need to take that into account, and use data rationally.

15. The City Council thinks that having more Cats in the city would help scare off birds. They are so happy with your work on the Bird detector that they also hire you to build a Cat detector. (Wow Cat detectors are just incredibly useful aren't they.) Because of years of working on Cat detectors, you have such a huge dataset of 100,000,000 cat images that training on this data takes about two weeks. Which of the statements do you agree with? (Check all that agree.)

1 / 1 point

☑ If 100,000,000 examples is enough to build a good enough Cat detector, you might be better off training with just 10,000,000 examples to gain a ≈10x improvement in how quickly you can run experiments, even if each model performs a bit worse because it's trained on less data.

✓ Correct

Buying faster computers could speed up your teams' iteration speed and thus your team's productivity.

✓ Correct

✓ Needing two weeks to train will limit the speed at which you can iterate.

✓ Correct

Having built a good Bird detector, you should be able to take the same model and hyperparameters and just apply it to the Cat dataset, so there is no need to iterate.
