Bird Recognition in the City of Peacetopia (Case Study)

LATEST SUBMISSION GRADE 90%

1. Problem Statement

This example is adapted from a real production application, but with details disguised to protect confidentiality.

You are a famous researcher in the City of Peacetopia. The people of Peacetopia have a common characteristic: they are afraid of birds. To save them, you have to build an algorithm that will detect any bird flying overPeacetopia and alert the population.

The City Council gives you a dataset of 10,000,000 images of the sky above Peacetopia, taken from the city's security cameras. They are labelled:

- y = 0: There is no bird on the image
- y = 1: There is a bird on the image

Your goal is to build an algorithm able to classify new images taken by security cameras from Peacetopia.

There are a lot of decisions to make:

- · What is the evaluation metric?
- · How do you structure your data into train/dev/test sets?

Metric of success

The City Council tells you that they want an algorithm that

- 1. Has high accuracy
- 2. Runs quickly and takes only a short time to classify a new image.
- 3. Can fit in a small amount of memory, so that it can run in a small processor that the city will attach to many different security cameras.

Note: Having three evaluation metrics makes it harder for you to quickly choose between two different algorithms, and will slow down the speed with which your team can iterate. True/False?

True

1/1 point

- "We need an algorithm that can let us know a bird is flying over Peacetopia as accurately as possible."
- "We want the trained model to take no more than 10sec to classify a new image."
- "We want the model to fit in 10MB of memory."

If you had the three following models, which one would you choose?

\bigcirc	Test Accuracy	Runtime	Memory size
	97%	3 sec	2MB

0	Test Accuracy	Runtime	Memory size
	97%	1 sec	ЗМВ

\odot	Test Accuracy	Runtime	Memory size
	98%	9 sec	9MB

O B:

Test Accuracy	Runtime	Memory size
99%	13 sec	9MB

✓ Correct

Correctl As soon as the runtime is less than 10 seconds you're good. So, you may simply maximize the test accuracy after you made sure the runtime is <10sec.

3. Based on the city's requests, which of the following would you say is true?

1/1 point

- Accuracy is an optimizing metric; running time and memory size are a satisficing metrics.
- Accuracy is a satisficing metric; running time and memory size are an optimizing metric.
- Accuracy, running time and memory size are all satisficing metrics because you have to do sufficiently well on all three for your system to be acceptable.
- Accuracy, running time and memory size are all optimizing metrics because you want to do well on all three.

4. Structuring your data

1 / 1 point

Before implementing your algorithm, you need to split your data into train/dev/test sets. Which of these do you think is the best choice?

\circ	Train	Dev	Test
	3,333,334	3,333,333	3,333,333

0	Train	Dev	Test
	6,000,000	3,000,000	1,000,000

\bigcirc	Train	Dev	Test
	6,000,000	1,000,000	3,000,000

Yes.

	✓ Correct		
•	No, because there is insufficient information to tell.		
0	Yes, because this shows your bias is higher than your variance.		
0	No, because this shows your variance is higher than your bias.		
0	Yes, because having 4.0% training error shows you have a high bias.		
	s suggests that one good avenue for improving performance is to train a bigger ning error. Do you agree?	network so as to drive down the 4.0%	
	Dev set error	4.5%	
	Training set error	4.0%	
7. You	train a system, and its errors are as follows (error = 100%-Accuracy):		1/1 poi
	✓ Correct

What does this mean? (Check the two best options.)

2.1% 7.0%

Dev set error

Test set error

ı	You should get a bigger test set.	
١	✓ You should try to get a bigger dev set.	
	✓ Correct	
	You have underfit to the dev set.	
١	You have overfit to the dev set.	
	✓ Correct	
12.	After working on this project for a year, you finally achieve:	1/1 p
	Human-level performance 0.10%	
	Training set error 0.05%	
	Dev set error 0.05%	
	What can you conclude? (Check all that apply.)	
١	$ ilde{f V}$ If the test set is big enough for the 0.05% error estimate to be accurate, this implies Bayes error is ≤ 0.05	
	✓ Correct	
	Correct	
	With only 0.09% further progress to make, you should quickly be able to close the remaining gap to 0%	
(This is a statistical anomaly (or must be the result of statistical noise) since it should not be possible to surpass human-level performance.	
١	✓ It is now harder to measure avoidable bias, thus progress will be slower going forward.	
	✓ Correct	
	It turns out Peacetopia has hired one of your competitors to build a system as well. Your system and your competitor both deliver systems with about the same running time and memory size. However, your system has higher accuracy! However, when Peacetopia tries out your and your competitor's systems, they conclude they actually like your competitor's system better, because even though you have higher overall accuracy, you have more false negatives (failing to raise an alarm when a bird is in the air). What should you do?	0/1p
(Ask your team to take into account both accuracy and false negative rate during development.	
(Pick false negative rate as the new metric, and use this new metric to drive all further development.	
(Look at all the models you've developed during the development process and find the one with the lowest false negative error rate.	
(Rethink the appropriate metric for this task, and ask your team to tune to the new metric.	
	× Incorrect	

	ou have only 1,000 images of the new species of bird. The city expects a better system from you within the next 3 months. Which of these should you do first?	
(Use the data you have to define a new evaluation metric (using a new dev/test set) taking into account the new species, and use that to drive further progress for your team.	
	Put the 1,000 images into the training set so as to try to do better on these birds.	
	Try data augmentation/data synthesis to get more images of the new type of bird.	
(D: Add the 1,000 images into your dataset and reshuffle into a new train/dev/test split.	
	✓ Correct	
t E	The City Council thinks that having more Cats in the city would help scare off birds. They are so happy with your work on he Bird detector that they also hire you to build a Cat detector. (Wow Cat detectors are just incredibly useful aren't they.) Because of years of working on Cat detectors, you have such a huge dataset of 100,000,000 cat images that training on his data takes about two weeks. Which of the statements do you agree with? (Check all that agree.) Having built a good Bird detector, you should be able to take the same model and hyperparameters and just apply it to the Cat dataset, so there is no need to iterate. Needing two weeks to train will limit the speed at which you can iterate.	1/1 point
	✓ Correct	
	✓ If 100,000,000 examples is enough to build a good enough Cat detector, you might be better off training with just 10,000,000 examples to gain a ≈10x improvement in how quickly you can run experiments, even if each model performs a bit worse because it's trained on less data.	
	✓ Correct	
	Buying faster computers could speed up your teams' iteration speed and thus your team's productivity.	
	✓ Correct
